# **Waratah and Somerset Combined Sale**

**80 Rams ~ 15 Stud Ewes**

**Ram Pavilion, Hamilton Showground's**

**2.00 pm Wednesday October 13th**

Inspection from 12.00 noon

Light refreshments provided

Waratah White Suffolks - Steve & Debbie Milne  
Branxholme ~ 03 55786327

Somerset White Suffolks - Lachie & Kylie McCrae  
Bulart ~ 03 55741240

**Bernie Grant— LMB Linke— 0417 712144**

**3% rebate to outside Agents**

**Please note - To be eligible for transfer as a stud sire  
rams must sell for a minimum of \$1500 (plus GST)**

# LAMBPLAN

The information in this catalogue is to help you make an informed decision on the objective merits of the sheep on sale. The ASBVs can be used to select the sheep that will most suit your growing conditions and the market that you are aiming to service.

An ASBV is an estimate of the genetic potential a sheep will pass on to its progeny. ASBVs are available for a range of economically important traits and are designed to be used in conjunction with visual selection.

The appearance and performance of an animal is a combination of its genes and the environment in which it is raised (e.g. the amount and quality of feed, single or twin birth type). ASBVs account for these environmental effects, allowing the comparison of sheep based on the genes they will pass on to their progeny. It is important to remember when selecting sheep you are choosing the genes, not the environment.

## ASBV's

ASBVs are expressed as either positive or negative deviations from an average. For example, a ram with a post weaning weight (Pwwt) of +10.2, will have progeny that will on average be 5.1kg heavier at post weaning than an animal with a Pwwt ASBV of 0. (Rams contribute half the genetics of their progeny the ewe the other half)

## ASBV ACCURACY (%)

This is a reflection of the amount of information available on each animal for each trait. As the amount of information increases the accuracy increases. The higher the accuracy, the closer the ASBV is to the true breeding value of the animal.

## Bwt: Birth Weight (kg)

Rams with more negative BWT ASBVs produce lambs which are lighter at birth. *(BWT ASBVs estimate the genetic difference between animals in live weight at birth)*

**Pwwt: Weight (kg)** - Rams with more positive WT ASBVs produce progeny that grow quicker and are heavier at a certain age. Pwwt refer to lambs at 7 to 10 months of age. *(WT ASBVs estimate the genetic difference between animals in live weight at a given age)*

## Pfat: Fat Depth (mm)

Rams with more negative FAT ASBVs produce progeny that are leaner. *(FAT ASBVs estimates the genetic difference between animals in GR fat depth)*

**Emd: Eye Muscle Depth (mm)** - Rams with more positive ASBVs for EMD will produce progeny that have more muscle, independent of weight, and a higher lean meat yield. *(EMD ASBVs estimate the genetic difference between animals in eye muscle depth at the C site)*

# LAMBPLAN

**WEC: Worm Egg Count (%)** - Rams with more negative WEC ASBVs produce progeny who have a higher genetic potential to resist worm burdens. Lower WEC ASBVs are desirable. *(WEC ASBVs estimate an animal's genetic ability for carrying worm burdens. This is a combination of being genetically less likely to pick up worms, and being able to cope immunologically with the worm burden. WEC ASBVs are expressed as a percentage relative to a count of 500 eggs per gram)*

## Sheep Selection

Selecting animals involves balancing several key traits. To make selection easier traits can be combined into a selection index. A selection index combines ASBVs for several traits to give a single value. This reflects the performance of the sheep relative to the breeding objective of the particular index.

## Index types include:

### \$ Value Indexes:

A dollar index indicates the value of an animal based on its suitability for a particular market. The value is given in real dollar figures and expressed as \$/ewe joined/ yr. For example a dollar index of 105 indicates that a ram will produce \$5 extra value for every ewe joined compared to a ram with an \$ index of 100. Therefore over four years, if a ram produces 200 progeny, the extra value produced by that ram will be  $\$5 \times 200 = \$1,000$ . **Lamb 2020 combines the usual production traits of growth fat and muscle but also includes birth weight and worm resistance.**

### Desired Gains Indexes:

Work on a proportional gain of a combination of traits. For example the **Carcase Plus index puts 60% emphasis on increasing growth, 20% on decreasing fat and 20% on increased eye muscle depth.**

When using an index it is important that the aim of the index matches your flock's breeding objective, putting emphasis on your economically important traits. While indexes are useful tools, it is important to always consider individual trait ASBVs to ensure you are selecting genetics that will have the desired effect on your flock.

(The above information is sourced from - "A Pocket Guide to ASBVs Australian Sheep Breeding Values", Sheep Genetics, MLA, April 2009.)

## Average ASBVs for the 2010 White Suffolk drop are:

<b>Bwt</b>	<b>Pwwt</b>	<b>Pfat</b>	<b>Pemd</b>	<b>Carcase+</b>
<b>0.25</b>	<b>9.4</b>	<b>-0.7</b>	<b>+0.7</b>	<b>161</b>

## Changes to Lambplan ASBV's

Since the last ram selling season there have been a number of changes implemented in the LAMBPLAN analysis for all terminal breeds. As a result of these changes you may notice that the ASBVs reported in sale catalogues this year show a slightly different range. It is important to note that these changes apply to all animals in the database and generally animals have not re-ranked. Animals that had previously ranked in the top 10% of the breed are generally still in the top 10%.

The most significant change is that Birth Weight (BWT) ASBVs have increased, the average value has increased by 0.1 kg. It is therefore recommended that producers increase their acceptable ranges for BWT by this amount. For example, if the heaviest BWT ASBV you have previously been prepared to use was +0.4 kg, that range could now be increased to +0.5 kg with the same birth weights resulting in the ram's progeny.

At the same time Weaning Weight (WWT) and Post Weaning Weight (PWT) ASBVs have on average decreased by 0.4 kg and 0.7 kg respectively. Index values have also decreased. For example, Carcase Plus (C+) values have on average decreased by approximately 5 points. Rams that would previously had C+ values of +185 may now be expected values around +180.

When using ASBVs and Indexes it is important to compare the individual animal's values to the breed average and/or the percentile bands table to assess the animal's relative merit and identify where it ranks within the breed.

If you require any further information regarding the use of ASBVs and Indexes, please contact the Sheep Genetics staff on 02 6773 2948.

# **Waratah**

**Flock No 318**

**Steve & Debbie Milne, Sunning Hill, Branxholme, 55786327**

## ***Vision, Performance, Integrity***

Waratah White Suffolk Stud was founded in October 1995. Foundation ewes were purchased from Detpa Grove, the White Suffolk National Sale and Gadang.

AI and ET programs are used to source the best genetics available in Australia. These have included sires such as Far-rer 74, Woolumbool 8017 and Anden 83. Waratah has produced proven sires such as Waratah 15, used by 41 studs across Australia with over 1350 progeny and Waratah 657, also used extensively throughout Australia.

Since foundation the Waratah flock has been performance tested through Lambplan. Rapid genetic improvement has been made in the economically important traits of growth and muscling. At the same time, selection pressure is placed on easy lambing, fertility, parasite resistance and structural soundness.

Our goals are to produce rams that will sire lambs to meet the requirements of the heavy trade/light export market specifications. To that end, we aim to produce rams with low birth weight, high growth rate, moderate fat (too lean and the lambs will be hard to finish) and high yielding carcasses.

All Waratah sale sheep were drenched (Cydectin), vaccinated (6 in 1) and backlined (Magnum) in September. The flock is Brucellosis accredited (Accreditation No. 3463), OJD MAP MN3 - V (VS1167) and the sale sheep have 8 Assurance Based Credit (ABC) points.

### ***MUSCLE WHERE IT MATTERS***

Somerset White Suffolk Stud was founded in 1997 with the purchase of ewes from the 'Wakefield Park' White Suffolk Stud. Top quality genetics have been infused with a focus on muscling and growth, using EBV and actual measurements to select from some of the breeds top sires. Whilst muscling and growth are of the utmost importance, breed type and the wonderful Suffolk characteristics will not be sacrificed under any circumstance, which gives lamb producers the utmost confidence to use our genetics over any type of ewe with success.

Lambplan remains an important tool to measure our progress against the progress of the breed using across flock E.B.V's. Physical assessment is a priority within the stud to ensure correct structure and breed type are maintained, therefore providing lamb producers with a selection of high quality, sound flock rams to benefit their prime lamb enterprise.

Exhibiting a show team at Sheepvention and Adelaide shows has enabled us to compare our best with the leading animals within the breed. This year we have continued on from our success last year, with all rams being exhibited at Adelaide show winning ribbons, with the highlight being awarded Reserve Junior Champion Ram. This ram was then sold at the Elite Sale for \$6000 to the Chesson Park and Richmond Park Studs.

We maintain Ovine Brucellosis Accreditation and participate in the Ovine Johnes Disease Market Assurance Program (MN1) with an ABC score of 7.

All rams were vaccinated in April with 6 in 1 + selenium and B12, drenched and shorn 12<sup>th</sup> September, Gudair vaccine at lamb marking (Sept '09).
